Product Catalog

Overview of how products are created & stored in Sweed

Updated over 2 months ago

Table of contents

Sweed's Catalog Structure

Definitions

Products and Variants

Items in Sweed are largely broken up into two parts, *Products* and *Variants*. A product represents an item with all sizes and types possible. A variant is a specific size or type of that item.

Example: A product in the Flower Category might have the title of Sour Diesel Premium, with Sour Diesel as the strain and Lemon Tree as the brand. That product could have 5 variants with the sizes of 1g, 3.5g, 7g, 14g, and 28g respectively.

Product Naming

Product names in Sweed are dynamically generated using a combination of product attributes to ensure clarity and consistency across the platform. These concatenated names help staff and customers easily identify products in both internal workflows and customer-facing tools like receipts and online menus.

The exact structure of the product name may vary slightly depending on where it is displayed. Below is a breakdown of how product names are constructed in each part of the system:

Location	Concatenated Format
Store Portal – Products	Brand + Quality Line + Name + Product Type <i>(or Brand + Name if no Quality Line or Product Type is Selected)</i>
Store Portal – Discount Engine	Brand + Quality Line + Name + Product Type + Variant
Cashier Portal – Product Cards	Brand + Quality Line + Name + Product Type + Variant
Pre-Receipts	Brand + Quality Line + Name + Product Type + Variant <i>(or Brand + Name + Variant if no Quality Line or Product Type is Selected)</i>
Customer Receipts	Brand + Quality Line + Name + Product Type + Variant <i>(or Brand + Name + Variant if no Quality Line or Product Type is Selected)</i>
E-Commerce Menu & Cart	Name + Product Type <i>(or Name if no Product Type is Selected)</i>

Sizes

A size represents the quantity of the product sold and can be represented by weight or a unit count. Each size will have the following attributes:

- Name

3 of 6

9/11/25, 9:47 PM

- **Size**
- **Unit of Measurement**

Categories

A category represents the type of cannabis product being sold, typically there are at least four categories for any store: Flower, Concentrates, Edibles, and Topicals. When you create a category, you must specify what sizes are selectable for items in that category. Each category will have the following attributes:

- **Name**
- **Limit Type** - The limit type defines how purchases made in this category should count towards a customer's allotment.
- **Class** - Class defines whether a category contains products with cannabis. Typically the only non-cannabis categories are Merchandise or Accessories.
- **Legal Age** - In some states specific products may have a different legal purchasing age than others. For example, in NJ patients can purchase medical cannabis at the age of 18, but need to be 21 to purchase vape cartridges.
- **Sizes** - Defines what sizes can be assigned to products in the category. Although this may seem like overkill, it is vital to ensure that each product has the correct size because Sweed uses this value to calculate the purchase limits for each customer.
- **Product Types** - Defines what product types can be assigned to products in the category.
- **Subcategories** - Defines what subcategories can be assigned to products in the category.

Subcategories and Product Types

Subcategories and Product Types are very similar but have a few key differences.

- Product types can be used in multiple categories, while a subcategory can *only* be used for products in a single category. *Example:* The product type "glass" could be used for products in a category named "Bongs" and a category named "Pipes", while the subcategory "solvent-less" can only be applied to products in a category named "Concentrates".
- The product type is included in the product name visible to customers, while the subcategory is not. The product type is also visible when employees need to select a product to filter by in the reporting tool, the discount engine, or the customer segmentation engine. If two products are near identical with the exception of one attribute, that attribute should be defined as a product type instead of a subcategory so customers and employees can easily differentiate between the two. *Example:* A flower strain "Gorilla Glue" might be available as buds, littles, or shake. In this case, "buds", "littles", and "shake" should be defined as product types so that users see "Gorilla Glue Buds" and "Gorilla Glue Shake" instead of two "Gorilla Glue" products with the same name, image, and test results.

Other Product Attributes

- **Tags** - Tags are somewhat similar to hashtags commonly used on social media platforms. They're used to help your customers find the products they're looking for. Each product can have an unlimited number of tags, and when users search for a term, products whose tags contain that term will be displayed in the results.
- **Quality Lines** - Quality lines denote the quality class of a product. This is very similar to the "top shelf" vs "bottom shelf" terminology typically used at bars and other alcoholic establishments. Each organization can define their own levels and names for their quality lines.
- **Strains** - Strains are a common attribute in the cannabis industry, but in Sweed you can define the lineage, flavors, and terpenes each strain contains.
- **Strength Levels** - A strength level gives the user a broad idea of the potency level for each cannabis product. Even seasoned cannabis users may not have a good handle on how much THC is a lot - if they have been buying cannabis in a pre-legalized market their dealer is unlikely to have provided the THC test results for the products

they bought. Strength levels in Sweed are defined by THC level. *Example:* Low 0-15%, Medium 15-25%, High 25%+

Brands & Distributors

In Sweed each *product* has a Brand, and each *variant* has a list of distributors. A Brand is the producer of the item and the Distributor is the licensed business that sold the item to the retailer. In many states these two are not always the same entity.'

Variant Costs (Most Recent Wholesale Price)

The "Most Recent Cost" for a Distributor Product is based on the latest received cost across any store in the state. If multiple costs are recorded in a single purchase, the highest is used. If no purchases have been made, the system defaults to the most recently created Distributor Product. Trade sample costs are excluded.

A "Most Recent Cost" column appears in the Variants Table (after the "Price" column). It is filterable and may be empty if no Distributor Products exist. A tooltip explains that the value reflects either the most recent received cost or, if unavailable, the latest created Distributor Product.

On the Variant Page, the Costs section under Prices displays the most recent cost and associated Distributor. If multiple Distributor Products exist, all costs can be viewed. The Wholesale cost field is editable for both manually created and integrated Distributor Products. This section is hidden if no Distributor Products exist, and it does not appear when creating a new Variant.

These costs apply only to non-integrational purchases and do not affect purchases made through integrations.

STRENGTH LEVEL:

9 Strain Sweet & Sour Widow CBD #4	12 Flavors -
10 Terpenes -	13 Effects -
11 Unit Size 0.13oz	14 Package Size 0.13oz

15 **DESCRIPTION**
Bred by CBD Crew, Sweet and Sour Widow is a 70/30 indica-dominant cannabis strain with a 1:1 CBD-THC ratio and a subtle sweet onion aroma. Because of its balanced cannabinoid profile, Sweet and Sour Widow's psychoactive effects are mild, making this strain suitable for novice consumers and patients needing to medicate without a foggy head. Sweet and Sour Widow is derived from White Widow genetics and an unnamed sativa-hybrid to accentuate its CBD profile.

Product Creation Flow

When you need to create a new product, ensure that the following corresponding items are created & configured first:

1. The **Brand** is *created*
2. The **Category** is *created*
3. The relevant **Subcategory** is *created*
4. The relevant **Product Type** is *created*
5. The relevant **Product Type** has been *added to the Category*
6. The relevant **Strain** has been *created*
7. The relevant **Size** has been *created*
8. The relevant **Size** has been *added to the Category*

Note: Each product may not require a subcategory, strain, or product type. If the product you are trying to create does not contain these attributes, simply skip the associated steps.

Then follow the instructions for creating a product & it's variants here: <https://help.sweedpos.com/en/articles/6546062-create-a-product>
